

ALERT ID	SOURCE SYSTEM	ALERT TIME	ANALYST
CLD-0108	Identity Monitoring (Entra id sign-in logs)	2026-09-01 03:54 UTC	Eshak Basta

ALERT (WHAT FIRED, ON WHOM OR WHAT):

- The "Unfamiliar sign-in properties" rule fired after a successful sign-in for `gwen.muir@cloudora.io` at 03:54 UTC from `198.18.163.41`. The sign-in originated from London, United Kingdom, using Windows 10, Firefox, and the IMAP4 client application. The "Unfamiliar sign-in properties" rule fired after a successful sign-in for `gwen.muir@cloudora.io` at 03:54 UTC from `198.18.163.41`. The sign-in originated from London, United Kingdom, using Windows 10, Firefox, and the IMAP4 client application.

HYPOTHESIS (BOTH DIRECTIONS):

- Malicious: An unauthorized user accessed the account using a previously unseen sign-in method.
- Benign: The user legitimately accessed the account from a new device, application, or network.

EVIDENCE CHECKED:

- Reviewed `cloudora_signin_slice.csv` to establish Gwen Muir's historical sign-in baseline.
- Used KQL queries in Azure Data Explorer to analyze historical sign-in patterns, including IP addresses, locations, login times, devices, browsers, and applications.
- Confirmed that `203.0.113.12` was the user's normal IP address and accounted for 32 successful sign-ins from London.
- Identified that most successful authentications occurred during normal business hours.
- Compared the alert event against the established baseline and identified deviations in IP address, login time, browser, and client application.

- Queried CloudoraAudit_CL using KQL to identify any account modifications or follow-on activity after the 03:54 UTC sign-in. No audit events were returned.

VERDICT:

True positive	False positive	Duplicate	Escalate	Insufficient data
---------------	----------------	-----------	----------	-------------------

SEVERITY:

- Sev 3 – Probable activity with medium impact.
- The alert was assigned to **Sev 3** because the authentication event deviated from the user's established baseline across multiple indicators, including the IP address, login time, browser, and client application. However, the investigation did not identify any follow-on account changes, mailbox modifications, or other evidence confirming account compromise. The activity was considered suspicious and required escalation for additional investigation rather than immediate closure or classification as a confirmed compromise.

ACTION:

- Escalate to the Identity and Access Management team for additional investigation. Review mailbox activity, IMAP4 usage, message access logs, and any subsequent activity associated with 198.18.163.41. Verify whether legacy authentication is authorized for the account.

JUSTIFICATION:

- Historical sign-in activity and KQL analysis established a consistent baseline that did not match the 03:54 UTC authentication. The sign-in originated from a new IP address, used an unfamiliar client application, occurred outside the user's normal login window, and could not be confidently classified as legitimate with the available evidence.

MITRE ATT&CK:

- **T1078.004 – Valid Accounts: Cloud Accounts (suspected).** A successful authentication using valid credentials deviated from the user's established baseline and required escalation.
